

# HOOKLIFT BODY

## FLATBED MFL 11

**CMT has produced a new hook lift flatbed which is better matched to the market's demands for flatbeds with low height. Naturally, the body is designed for an all-up weight of 24 tonnes.**

The rear section is sloped off as standard. Together with movable ramps which taper to zero, this makes it easier to load machines with a low ground clearance such as fork lifts and lifts. The floor surface is made as smooth as possible, with timber flooring between the edge rail and the chassis member and diamond plate in the middle and at the front.

However, the greatest innovation is the integral anchoring beams. In these beams, stakes can be moved as close as possible to the load, and tensioners can be attached to them. This makes it much easier to anchor the goods.

The flatbeds can be offered with a variety of different ramp solutions as well as other equipments as fore example curtain sides.
