

HOOKLIFT BODY

CRANE BODY

CMT crane bodies are available with the same specifications as CMT drop-side bodies. The load swap body is also prepared with fixing points for various cranes, and is adapted for the various load swap systems on the market.

To handle larger cranes, the crane body is available with reinforced chassis members, enabling it to handle forces from cranes up to 30 tonne-metres.

A reversible version of the crane body is also now available. With a lowerable hook section at the rear, the load swap body can be swung round. In this way the crane is positioned further back and can reach a few metres further.

A simple way of getting greater reach. The lowerable hook section can also be used as a load surface when lowered, and can be easily moved up and down by means of the crane.
